## 2 Create SirIsaac FittingProblem

We'll attempt to fit a model in the "ssystem" class. To do this, we'll create an instance of a sFittingProblem. Here we set up its arguments and create it:

[12]: `# complexityList lists which models in the model class may be tested.  
# (Note that by default SirIsaac will still stop once 3 models have  
# smaller estimated log-likelihood.)  
complexityStepsize = 3 # increase complexity with steps of size 2  
complexityMax = 25 # don't try models with complexity > 25  
complexityList = range(0,complexityMax,complexityStepsize)  
  
# ensGen controls the generation of the initial ensemble of  
# parameter starting points.  
# (We use a small number for totalSteps here so that the example  
# runs faster; a more typical value for totalSteps is 1e3)  
totalSteps = 20 #1e3  
keepSteps = 10  
seeds = (1,1) # use a fixed random seed  
ensTemperature = 40.  
ensGen = fittingProblem.EnsembleGenerator( totalSteps, keepSteps,`

```

    temperature=ensTemperature, seeds=seeds )

# Parameters that control when local fitting stops.
avegtol = 1e-2
maxiter = 100

# priorSigma controls the width of priors on all parameters
priorSigma = 3.

# If you have mpi4py installed, you can run on multiple processors
numprocs = 4 #10

# We'll only use a subset of our data to make the example run faster
N = 20

p = fittingProblem.CTSNFittingProblem( complexityList,
    sirIsaacData[:N], indepParamsList=indepParamsList[:N],
    outputNames=outputNames, indepParamNames=indepParamNames,
    ensGen=ensGen, avegtol=avegtol, maxiter=maxiter,
    priorSigma=priorSigma, numprocs=numprocs, verbose=True )

```

for fitting problem, we can actually choose from `SimpleSinusoidalFittingProblem`, `SimplePhosphorylationFittingProblem`, `PolynomialFittingProblem`, `LaguerreFittingProblem`, `CTSNFittingProblem`, and `PowerLawFittingProblem`. PowerLawFittingProblem:  $\frac{dx}{dt} = x^{c_1}a - x^{c_2}b$

### 3 Run parameter fitting

```

## 4 Analyze the selected model

Here we plot predicted timecourses from the selected model for the first 10 in-sample initial conditions, using `plotBestModelResults`:

```
[14]: plt.figure(figsize=(20,2))
a = p.plotBestModelResults(plotInitialConditions=True, indices=range(10));

for i in range(len(a[0])):
    a[0][i].plot(RNAtheoreticalData[0], RNAtheoreticalData[1+i], linewidth=1)
    a[1][i].plot(ktheoreticaldata[0], ktheoreticaldata[1+i], linewidth=1)
plt.show()
```

```
maxLogLikelihoodName: Warning: Only 9 of 9 fits have been performed.
maxLogLikelihoodName: bestIndex > maxIndex. Returning None.
```

```
-----
AttributeError                                     Traceback (most recent call last)
<ipython-input-14-204fc9c0e868> in <module>
      1 plt.figure(figsize=(20,2))
----> 2 a = p.plotBestModelResults(plotInitialConditions=True, indices=range(10) ;
      3
      4 for i in range(len(a[0])):
      5     a[0][i].plot(RNAtheoreticalData[0],_
-> RNAtheoreticalData[1+i], linewidth=1)

~/SirIsaac/SirIsaac/fittingProblem.py in plotBestModelResults(self, modelName,_
-> maxIndex, verbose, **kwargs)
    750         m = self.getBestModel(modelName=modelName, maxIndex=maxIndex,
    751                         verbose=verbose)
--> 752         return self.plotModelResults(m, **kwargs)
    753

```

## 4.1 comment: error bar is too large!!

And now for out-of-sample data:

```
[15]: plt.figure(figsize=(20,2))
m = p.getBestModel()
b=m.plotResults(sirIsaacData[20:30],indepParamsList[20:30],
                 plotInitialConditions=True,plotFittingData=True);
for i in range(len(a[0])):
    b[0][i].plot(RNAtheoreticalData[0], RNAtheoreticalData[1+i], linewidth=1)
    b[1][i].plot(ktheoreticaldata[0], ktheoreticaldata[1+i], linewidth=1)
plt.show()
```

```
maxLogLikelihoodName: Warning: Only 9 of 9 fits have been performed.
maxLogLikelihoodName: bestIndex > maxIndex. Returning None.
```

```
-----
AttributeError                                                 Traceback (most recent call last)
<ipython-input-15-86f969c63866> in <module>
      1 plt.figure(figsize=(20,2))
      2 m = p.getBestModel()
----> 3 b=m.plotResults(sirIsaacData[20:30],indepParamsList[20:30],
      4                 plotInitialConditions=True,plotFittingData=True);
      5 for i in range(len(a[0])):

AttributeError: 'NoneType' object has no attribute 'plotResults'
```

<Figure size 1440x144 with 0 Axes>

We can look at the selected model's parameters:

```
[ ]: m = p.getBestModel()
print(m.getParameters())
```

The following will use SloppyCell to output a latex file with the ODEs describing the selected model:

```
[ ]: m = p.getBestModel()
fittingProblem.IO.eqns_TeX_file(m.net,filename='mRNAConcentrationS2.tex')
```

```
[ ]: import os
print(os.getcwd())
```

$$k_0 = k_{tx}$$

$$\delta_m = k_{md}$$

$$k_1 = k_{tr}$$

$$\delta_p = k_{pd}$$

```
[ ]: import numpy as np
import matplotlib.pyplot as plt
